Connected User Scenarios

Waste Management System - sticky-board journey map

Manager

1. Morning review

The Waste Management Manager opens the dashboard, checks fill levels, truck locations, and today's schedule, then spots bins that are close to overflowing.

Manager

2. Route approved

The system suggests a better route. The manager adjusts collection priorities and approves the updated plan so the urgent areas are handled first.

Driver

3. Driver starts shift

The Truck Driver opens the mobile app, receives the optimized route, and follows step-by-step navigation to each collection point.

Driver

4. Collection update

After emptying bins, the driver marks them as collected. A damaged bin is reported in the app so the issue is recorded immediately.

Technician

5. Repair task sent

The Field Operator receives a maintenance task with the exact location, travels to the site, repairs the bin, and uploads a photo as proof.

Facility

6. Waste processed

At the facility, the manager sees incoming trucks, records waste type and quantity, and flags contaminated waste to protect recycling quality.

Citizen

7. Public report tracked

A citizen reports a full bin or illegal dumping through the reporting interface and follows the request status until it is resolved.

Oversight

8. Insights and support

ECO Tirana and the Municipality review KPIs, costs, and environmental impact, while the IT Administrator keeps the platform secure, available, and backed up.
